

Abstract

[0095] The subject invention is for creating and managing enterprises online by means of applications running on a server in a data network environment. The server can be accessed from clients over the data network and the Application programs can be started by means of a graphical interface offered to the clients. The processed data of the application programs can be accessed by the clients or stored on distributed resources of the data network. In addition, the applications generate data relevant for creating and/or managing enterprises or databases.
